Claude Code has a planning mode that prevents 80% of errors. IT'S BEEN THERE THE WHOLE TIME. NOBODY TOLD YOU.

> **Shift+Tab.** That's it. Plan Mode forces Claude to write out every step and ask questions before touching a single file.
You approve the plan, then it codes. Error rate drops immediately.

> **16 commands and settings most people never find:**

/init on every new project. Claude scans your codebase and builds claude.md - an architecture cheatsheet it reads every session. Zero re-explaining.

/st turns on a live dashboard. Token spend and costs in real time. You see exactly what's eating your context.

At 60% memory - run /compact. Claude compresses history and keeps going. Hit /clear when switching to a completely new task.

Keep claude.md under 150 lines. Use it as a router - link to other files instead of dumping everything inside. Saves tokens on every single request.

"Junior rule" - never give commands, give problems. Ask Claude to reason out loud and keep asking questions until it's 95% sure about the task.

/re rolls back one step instantly without breaking the chat. Use it the moment Claude goes sideways - don't wait for it to finish.

/loop runs checks on a schedule. /hooks sends you a sound notification when a long generation finishes.

Bookmark this. The second part will be posted soon.

I spent 400 hours in Claude Code. The skills that make real money are embarrassingly simple.

Clients don't pay for impressive AI. They pay for boring tools that save time, cut costs, and remove human error. That's it....
